

Earth's Global Oceans

Oceans cover 71% of Earth's surface. They contain 97.33% of the planet's water in saline form. Along with the crust, oceans hold 15.4% of dihydrogen in combined forms, serving as a vital chemical reservoir.

Beyond their chemical importance, oceans teem with diverse marine life. From microscopic plankton to the massive blue whale, these waters provide crucial habitats for countless species. Coral reefs, often called the rainforests of the sea, support vibrant ecosystems essential for maintaining the health of our planet's aquatic environments.
